

# Motivation for Multilayer Perceptron

# Logistic Regression

Sigmoid Function  $p(y_i = 1|x_i) = \sigma(z_i)$

$$z_i = (b_1 \times x_{i1}) + (b_2 \times x_{i2}) + \dots + (b_M \times x_{iM}) + b_0$$

$$= b_0 + x_i \odot b$$

$\uparrow$   
bias

$\uparrow$   
inner  
product

$z_i$

# Limitations of Logistic Regression

## Linear

- Linear classifiers can only represent limited relationships
- Often want to use a classifier that can handle non-linearities

Logistic regression is only effective  
when a linear classifier can easily  
distinguish between class 1 and 0
